# Get us some He triplet, please!

He triplet falling from the corona

3D line-tied sheared single dipole

Neutrals diffuse  
or percolate through  
field lines

$$\nabla \times E = -\frac{\partial}{\partial t} B$$

$$\nabla \times E = -\frac{\partial}{\partial t} B$$

# Filament chirality rules

Feature	Chirality	
		$N_{LW}$
1. Filament Channels Small Scale	<p style="text-align: center;"><b>Dextral</b></p>	<p style="text-align: center;"><b>Sinistral</b></p>
2. Filaments Medium Scale	<p style="text-align: center;"><b>Right bearing</b></p>	<p style="text-align: center;"><b>Left bearing</b></p>
3. Coronal X-Ray Arcades Large Scale	<p style="text-align: center;"><b>Left skew</b></p>	<p style="text-align: center;"><b>Right skew</b></p>
	Dominant in Northern Hemisphere	Dominant in Southern Hemisphere

# Using chirality rules to solve the 180° ambiguity

Observed  
B (line of sight)

B (vertical)  
reconstructed  
from 180° soluti

# Chirality-based ambiguity resolution gives dips

Photospheric dips measured below a filament foot and within its channel

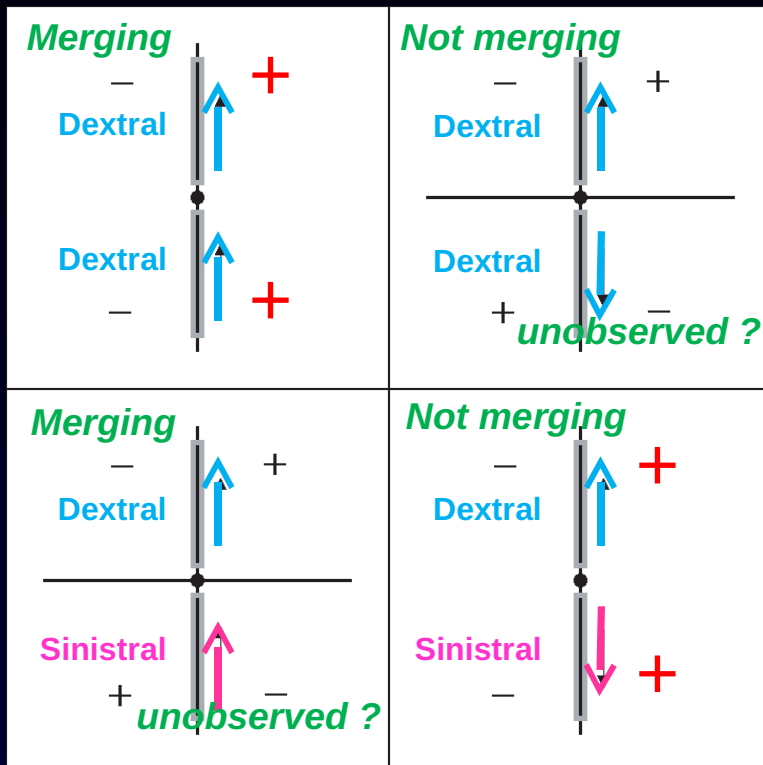

# MHD simulations of interacting sheared arcades

MHD simulations of  
3D line-tied sheared **DOUBLE** dipoles

Observations of interacting filaments  
during coordinated Joint Observing Programs

*DeVore et al. (2005), Aulanier et al. (2006)*

*Deng et al. (2002) & Schmieder et al. (2004)*

**Merging** ⇔ Same axial field direction  
⇔ Same magnetic helicity sign for bipolar fields

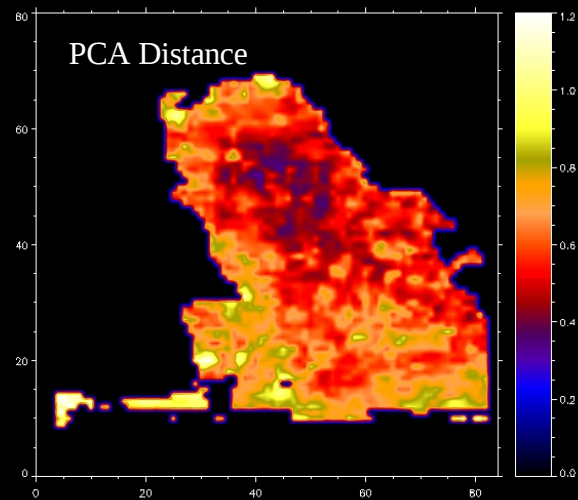

**Merging** ⇔ Same filament chirality  
⇔ Same magnetic helicity sign
